

To control feedlot or swine odor, you should first start with treating the drinking water of farm animals with dilute Oxy Blast (enhanced hydrogen peroxide). The most important factor is odor control. The benefits should outweigh the costs for it aids in the digestive process for metabolizing the feed.

For treating liquid waste or slurry effectively, the volume must be known of the pits, tanks, lagoons or ponds. The research has been done by a company and by a university who found it to be the most effective and cost effective.. Field trials were done in Pennsylvania, Indiana, Minnesota and Ontario, Canada. The only feedback we received was they think they have a better fertilizer because Oxy Blast breaks down the lignin in the fiber and there is no odor. This is not just environmentally friendly but is 100% environmentally safe.
